## **METAL CASED PLEATS**

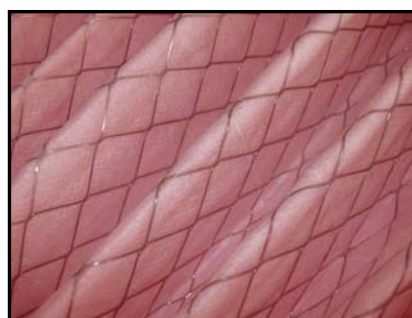

While having all the beneficial properties of the pleated panel filter, the MCP range provides a solution to problems of stability where moisture prevents the use of a card framed panel filter, and the rate of airflow prevents the use of a pad frame with glass fibre or synthetic pad.

Constructed of heavy-duty galvanized steel case, the outer frame gives maximum rigidity as well as greater fire-resistance (whilst the frame itself is totally fire-proof, the fire-resistance properties of the pleated filter material are the same as in a regular panel filter – all filters being inherently less fire-resistant once soiled).

The pleated inners are available in a range of efficiencies from EU4 to EU8, and in varying densities for different rates of airflow. There is also the optional extra of a heavy-duty wire 'W' clips or welded mesh facing for extra security.

Available in a wide range of standard sizes. Custom sizes to order.
